Section 1: The City of Norvale

The fictional city of **Norvale** is located in the country of **Eldoria**.
Norvale was founded in **1873** by an explorer named **Dr. Edwin Carroway**.

The city is known for its **three major districts**:

1. **Silvergate District** – famous for its research laboratories
2. **Larkspur District** – known for its large botanical gardens
3. **Ironbridge District** – the industrial and engineering center

Norvale has a population of **842,500 people as of 2024**.

The tallest building in Norvale is the **Carroway Tower**, which has **72 floors** and was completed in **2008**.

Section 2: The Orion Research Institute

The **Orion Research Institute (ORI)** was established in **1998** in the Silvergate District of Norvale.

ORI focuses on three primary research areas:

- Artificial Intelligence
- Space propulsion systems
- Climate modeling

The institute employs approximately **1,450 researchers**.

The current director of ORI is **Dr. Helena Voss**, who assumed the position in **2019**.

Section 3: Project Astra

In **2021**, ORI launched a project called **Project Astra**.

Project Astra is designed to develop **AI-assisted satellite navigation systems**.

The project has **three main components**:

1. **AstraCore** – the central AI reasoning engine
2. **AstraNav** – the satellite navigation algorithm
3. **AstraVision** – the Earth observation analysis module

The total budget allocated to Project Astra is **$320 million**.

The project timeline is **2021–2028**.

Section 4: The Helios Satellite

As part of Project Astra, ORI launched a satellite named **Helios-1**.

Helios-1 was launched on **March 18, 2023** from the **Aurora Spaceport**.

The satellite weighs **1,850 kilograms** and orbits the Earth at an altitude of **620 kilometers**.

Helios-1 collects approximately **3.2 terabytes of observation data per day**.

Section 5: The Aether Supercomputer

ORI also operates a supercomputer called **Aether**.

Aether was installed in **2020** and has the following specifications:

- **128,000 CPU cores**
- **6,400 GPUs**
- **Total compute performance of 540 petaflops**

Aether is used for training large-scale AI models and running climate simulations.

The system consumes approximately **9 megawatts of power during peak operation**.
